

Broadband over power lines just MAKES NO SENSE except to the utility companies and the manufactures that will produce filters and other devices designed to eliminate interference. I already cannot use my amateur radio station most of the time due to power line interference. I do not need rf modulating these problems. Also, from a technical standpoint, I think the additional signals traverrlling over the power lines will further hamper the location and repair of serious problems. Please do not allow this "technology" to pass just because the powerr companies want to get into the action of delivering these services.
